July 1999

RAILROAD SAFETY STATISTICS ANNUAL REPORT 1998

FOREWORD

The Federal Railroad Administration (FRA) has established an ultimate goal of "Zero Tolerance" for railroad-related accidents, injuries and fatalities. In pursuit of that goal, significant progress has been made, particularly over the past six years, in reducing the number of train collisions, derailments, highway-rail grade crossing incidents and injuries to railroad workers. These results have been achieved because of a collaborative effort involving the FRA, railroad management, rail labor, equipment suppliers and contractors, as well as other federal and state agencies whose mission involves ensuring railroad safety. Central to the success of this rail safety effort is the ability to understand the nature of rail-related accidents and to analyze trends in railroad safety.

The FRA's *Railroad Safety Statistics – Annual Report* is intended as a resource for the FRA's safety partners. It is also intended as a general reference source for individuals and organizations with an interest in rail safety issues. Statistical data, tables and charts are provided to depict the nature and cause of many rail-related accidents and incidents that occurred in 1998. Furthermore, selected historical data is included to provide a baseline for understanding the railroad industry's improving safety performance.

It is hoped that the information provided in this publication will provide insight into the most significant safety issues facing the rail industry and, in turn, lead to continued rail safety improvements. Only by continuing our understanding about how and why railroad accidents and incidents occur, can we hope to approach our goal of "Zero Tolerance."

This edition of the Railroad Safety Statistics compiles previous safety bulletins prepared by the Federal Railroad Administration (FRA). These include: the *Accident/Incident Bulletin*; the *Highway-Rail Crossing Accident/Incident And Inventory Bulletin*; and the *Trespasser Bulletin*. The consolidation of accident/incident statistics previously contained in other publications provides the reader with a single source for a comprehensive overview of railroad safety.

The completeness and accuracy of the information presented in this bulletin are primarily dependent upon the nation's railroad's data collection and reporting processes. The FRA conducts routine audits of these procedures, but does not have sufficient resources to perform comprehensive reviews of each railroad's reporting procedures. We extensively review and edit the reports we receive and make inquiry when information is incomplete or inconsistent.

Railroads are required by law to submit accident/incident reports within thirty days after the month to which they pertain. They are also required to update their report if the original information is incomplete or inaccurate. Railroads have until April 15 of the

following year to "close out" their records and submit any updates to complete their file.

It is not possible to identify reportable events that were omitted from a railroad's submission. Likewise, there may be instances where incorrectly reported information passes all reviews and is accepted. Although we attempt to be as vigilant as possible in both the editing and presentation of the accident/incident data reported, errors do occasionally occur.

Any questions, comments, or suggestions regarding the information contained in this publication should be brought to the attention of:

TABLE OF CONTENTS

Chapters

- 1 Overview of accidents/incidents**
- 2 Summary of 1998 accidents/incidents**
- 3 Casualty reporting**
- 4 Employee on duty casualties**
- 5 Train accidents**
- 6 Train accidents involving consist transporting hazardous material**
- 7 Total highway-rail incidents**
- 8 Highway-rail incidents at public crossings involving motor vehicles**
- 9 Highway-rail crossing inventory**
- 10 Trespassers, not at highway-rail crossings**

Appendices

- A Abbreviations**
- B Accident prediction and resource allocation procedure normalizing constants**

CHAPTER 1

OVERVIEW OF ACCIDENTS/INCIDENTS AND RATES

Railroads began reporting accidents to the Federal Government following passage of the Reports Act of 1910. The current definitions describing reportable events were adopted in 1975, and have remained largely unchanged since then. A number of modifications to the record-keeping and reporting requirements were put in place for 1997. These modifications did not redefine what was to be reported, but did expand the types of information being collected and the forms used for reporting. The changes made in 1997 were implemented for the purpose of collecting additional information necessary for safety analysis and to support the Federal Railroad Administration's (FRA) overall goal of hazard elimination and risk reduction on the Nation's railroads.

A railroad is required by Federal Railroad Administration (FRA) regulations at Title 49, Part 225 of the Code of Federal Regulations to use the current FRA Guide for Preparing Accident/Incident Reports ("Guide" or "reporting guide") when preparing its monthly report. The instructions and interpretations contained in this publication are provided to assist railroads in meeting this obligation.

"Accident/Incident" is the term used to describe the entire list of reportable events. These include collisions, derailments, and other events involving the operation of on-track equipment and causing reportable damage above an established threshold; impacts between railroad on-track equipment and highway users at crossings; and all other incidents or exposures that cause a fatality or injury to any person, or an occupational illness to a railroad employee.

Accidents/incidents are divided into three major groups for reporting purposes. These correspond to the following FRA forms:

Train accidents. A safety-related event involving on-track rail equipment (both standing and moving), causing monetary damage to the rail equipment and track above a prescribed amount. Reported on form FRA F 6180.54, RAIL EQUIPMENT ACCIDENT/ INCIDENT REPORT. (The threshold for 1998 was \$6,600)

Highway-rail grade crossing incidents. Any impact between a rail and highway user (both motor vehicles and other users of the crossing) at a designated crossing site, including walkways, sidewalks, etc., associated with the crossing. Reported on form FRA F 6180.57, HIGHWAY-RAIL GRADE CROSSING ACCIDENT/INCIDENT REPORT.

Other incidents. Any death, injury, or occupational illness of a railroad employee that is not the result of a "train accident" or "highway-rail incident." Reported on form FRA F 6180.55a, RAILROAD INJURY AND ILLNESS SUMMARY.

A single form is usually sufficient to report most events; however, there are situations when multiple report forms are necessary. An example is a highway-rail crossing incident resulting in

reportable injuries. An accident of this type would require the completion of both a Form FRA F 6180.57 and a Form FRA F 6180.55a. A Form FRA F 6180.54 must also be prepared if reportable on-track equipment and track damage in this accident exceeds the current monetary threshold for train accidents.

Because of overlap in the reporting requirements, some incidents may fall into multiple categories. The incident described above would be counted as a highway-rail incident, but it would also be included in the train accident total. Another example is a motorist hurt in a highway-rail incident after driving around gates at the crossing site. This individual is reported as a "trespasser" on form FRA F 6180.55a, but the event is classified as a highway-rail incident.

If there is an overlap in the information found in different chapters, when possible, a separate column or row total is provided, or counts are excluded when they are more appropriate to another chapter. In the example of the trespasser injured in a highway-rail incident, this injury appears in the highway-rail Chapter, but is excluded from the chapter on trespassing. The train accident counts in Chapter 5 include those highway-rail incidents causing reportable damage above the amount needed for reporting on form FRA F 6180-54. The user of this bulletin can exclude these, if desired, since the number of these are identified in most tables in this Chapter.

This bulletin provides overall national totals as well as specific area of safety concern. For example, Chapter 3 is a summary of all fatal and nonfatal casualties, regardless of the type of event causing them. Subsequent Chapters summarizing train accidents, highway-rail incidents, employee and trespassing casualties, provide additional information on the events causing these casualties.

The data is presented in the following general format. First, there is a graphic historical review of the major indicators of railroad safety since 1975. Following this, are overall totals for the 6-year period beginning with 1992, including summaries by railroad and states for this time frame. Next are a variety of tables and charts for the current year. The chapter for each major reporting area contains a description of the pertinent requirements and definitions associated with that specific accident/incident category.

Extensive consolidation of railroads has occurred over the years. In order to make a more valid comparison of major railroad systems, it was necessary to combine the information reported by predecessor railroads for the years prior to 1998. For example, data from railroads that made up the Southern Pacific Transportation System were merged into the Union Pacific counts.

Extensive consolidation of railroads has occurred over the years. In order to make a more valid comparison of major railroad systems, it was necessary to combine the information reported by predecessor railroads for the years prior to 1998. For example, data from railroads that made up the Southern Pacific Transportation System were merged into the Union Pacific counts.

TABLE 1-2 ACCIDENT/INCIDENT RATE SUMMARY

Category	1993	1994	1995	1996	1997	1998	% chg from 1996	% chg from 1998
1- Overall Accident/Incident Rate	21.83	19.15	16.60	15.05	14.14	13.78	-2.5	-36.9
2-								
3- Train Accidents, excludes HRC	4.25	3.82	3.67	3.64	3.54	3.77	6.5	-11.3
4- Yard Track Rate	15.87	14.91	14.23	14.22	14.41	15.60	8.3	-1.7
5- Other Track Rate	2.33	2.06	2.03	2.05	1.98	2.12	7.1	-9.0
6-								
7- Highway-Rail Incident Rate	7.97	7.60	6.92	6.34	5.71	5.14	-10.0	-35.5
8-								
9- All Other Incidents Rate	15.21	12.77	10.59	9.35	8.84	8.70	-1.6	-42.8
10-								
11- RR Employee on Duty Rate	5.93	5.06	4.24	3.66	3.31	3.27	-1.2	-44.9
12-								
13- Trespasser Rate	1.68	1.50	1.43	1.41	1.55	1.54	-0.6	-8.3
14-								
15- Passenger on Trains Rate	4.48	3.57	4.18	3.86	4.29	3.69	-14.0	-17.6
16-								
17- Passengers in Train Acc Rate	1.26	0.51	0.65	0.91	0.37	0.08	-78.4	-93.7

Overall accident/incident rate (line 1) is the total number of reportable incidents (train accidents, highway-rail, and other incidents) times one million divided by the sum of train miles operated and employee hours worked.

Train accident and highway-rail incident rates (lines 3 and 7) are the number of events per one million train miles operated.

The yard accident rate (line 4) is the number of accidents occurring on yard track per one million yard switching train miles operated.

The other track rate (line 5) is the number of accidents that did not occur on yard track per one million train miles, excluding yard switching train miles.

The employee on duty rate (line 11) is the total number of railroad employee casualties times 200,000 divided by the number of hours worked by employees.

Other incidents rate (line 9) is the number of other incidents times one million divided by the sum of train miles operated and employee hours worked.

The trespasser rate (line 13) is the total number of trespasser casualties, excluding those trespassers Fatal or injured in highway-rail incidents, per one million train miles operated.

The passenger on train rate (line 15) is the total number of passenger casualties in all accidents/incidents per 100,000,000 passenger miles. A passenger mile is the movement of one passenger for a distance of one mile.

The passenger in train accident rate (line 17) is the total number of passenger casualties in train accidents per 100,000,000 passenger miles.

CHAPTER 2

CURRENT YEAR SUMMARY OF ACCIDENTS/INCIDENTS AND RATES

The Federal Railroad Administration's (FRA) regulations on reporting railroad accidents/incidents are found primarily in Title 49 of the Code of Federal Regulations (CFR), Part 225 (49 CFR Part 225). The purpose of the regulations in Part 225 is to provide FRA with accurate information concerning the hazards and risks that exist on the Nation's railroads. FRA needs this information to effectively carry out its regulatory and enforcement responsibilities under the Federal railroad safety statutes. FRA also uses this information for determining comparative trends of railroad safety and to develop hazard elimination and risk reduction programs that focus on preventing railroad injuries and accidents. Issuance of these regulations preempts States from prescribing accident/incident reporting requirements. Any State may, however, require railroads to submit to it copies of reports filed with FRA under Part 225 for accidents/incidents that occur in that State.

These FRA accident/incident reporting requirements apply to all railroads except--

1. A railroad that operates freight trains only on track inside an installation which is not part of the general railroad system of transportation or that owns no track except for track that is inside an installation that is not part of the general railroad system of transportation and used for freight operations.
2. Rail mass transit operations in an urban area that are not connected with the general railroad system of transportation.
3. A railroad that exclusively hauls passengers inside an installation that is insular or that owns no track except for track used exclusively for the hauling of passengers inside an installation that is insular. An operation is not considered insular if one or more of the following exists on its line:
 - a. A public highway-rail grade crossing that is in use;
 - b. An at-grade rail crossing that is in use;
 - c. A bridge over a public road or waters used for commercial navigation; or
 - d. A common corridor with a railroad, i.e., its operations are within 30 feet of those of any railroad.

Part 225 covers any and all activities of a railroad related to the performance of its rail

transportation business. "Railroad transportation" means any form of non-highway ground transportation that run on rails or electro-magnetic guideways, including (1) commuter or other short-haul railroad passenger service in a metropolitan or suburban area, as well as any commuter railroad service that was operated by the Consolidated Rail Corporation as of January 1, 1979, and (2) high speed ground transportation systems that connect metropolitan areas, without regard to whether they use new technologies not associated with traditional railroads. Such term does not include rapid transit operations within an urban area that are not connected to the general railroad system of transportation.

Approximately 700 railroads currently submit accident/incident reports. It is not possible to display the safety record of each railroad in this publication. Consequently, the listing of individual railroads has been limited to those defined by the Surface Transportation Board (STB) to be Class 1 railroads, and other railroads reporting annual employees worked in excess of 400,000.

Railroads have been assigned to 1 of 3 groups in this bulletin. Group 1 corresponds to the railroads that have defined as Class 1; Group 2 includes railroads that reported at least 400,000 hours worked; and, Group 3 contains all other railroads.

In order to conserve space, most tables display the reporting code assigned to a railroad. Please see Table 2-8 for a listing of the code and railroad name.

Avg.	13.78	3.77	3.27	5.14	8.70	1.54	3.69	1.00	15.60	2.12

See following page for description of rates.

Total accident/incident rate (column 1) is the total number of reportable incidents (train accidents, highway-rail, and other incidents) times one million divided by the sum of train miles operated and employee hours worked.

Train accident and highway-rail incident rates (column 2 and 4) are the number of events per one million train miles operated.

The yard accident rate (column 9) is the number of accidents occurring on yard track per one million yard switching train miles operated.

The other track rate (line 5) is the number of accidents that did not occur on yard track per one million train miles, excluding yard switching train miles.

The employee on duty rate (column 3) is the total number of railroad employee casualties times 200,000 divided by the number of hours worked by employees.

Other events rate (column 5) is the number of other incidents times one million divided by the sum of train miles operated and employee hours worked.

The trespasser rate (column 6) is the total number of trespasser casualties, excluding those trespassers Fatal or injured in highway-rail incidents, per one million train miles operated.

The passenger on train rate (column 7) is the total number of passenger casualties per 100,000,000 passenger miles. A passenger mile is the movement of one passenger for a distance of one mile.

The passenger train accident rate (column 8) is the number of accidents involving passenger trains per one million passenger train miles operated.

Highway-Rail counts are excluded from other categories

CHAPTER 3 **CASUALTY REPORTING**

Any event connected with the operation of a railroad that results in one or more of the following consequences must be reported on Form FRA F 6180.55a:

1. Death of a person within 365 calendar days of the accident/ incident;
2. Injury to a person, other than a railroad employee, that requires medical treatment;
3. Injury to a railroad employee that requires medical treatment or results in restriction of work for one or more work days, the loss of one or more work days, termination of employment, transfer to another job, or loss of consciousness; or
4. Any occupational illness of a railroad employee.

A railroad need not report the following:

1. Casualties at highway-rail crossing sites that do not involve the presence or operation of on-track rail equipment, or the presence of railroad employees engaged in the operation of a railroad;
2. Casualties in or about living quarters that are not on the railroad premises and that do not arise from the operation of a railroad;
3. Suicides, as determined by a coroner or other public authority;
4. Attempted suicides.

The distinction between medical treatment and first aid depends not only on the treatment provided, but also on the severity of the injury being treated. First aid is:

1. Limited to one-time treatment and subsequent observation; and
2. Involves treatment of only minor injuries, not emergency treatment of serious injuries. An injury is not minor if:

- a. It must be treated only by a physician or licensed medical personnel;
- b. It impairs bodily function (i.e., normal use of senses, limbs, etc.);
- c. It results in damage to the physical structure of a nonsuperficial nature (e.g. fractures); or
- d. It involves complications requiring follow-up medical treatment.

One-time treatment of an injury should not be used as the sole basis for classifying a treatment or procedure as first aid. Medical treatment can, and often is, given on a one-time basis, e.g., the suturing of a wound. The procedures used and the skills required to treat an injury, as well as the seriousness of the injury, are all factors that must be considered when determining the type of treatment rendered.

Likewise, medical treatment cannot be determined solely on the basis of who treats a case. First aid treatment can be given by a physician, and medical treatment, by someone other than a physician.

The following are examples of typical medical treatment that are reportable:

Closure of a wound with suture (stitch), staple, Steristrip, butterfly, or the like.

The application of a cast or other professional means of immobilizing an injured part of the body, regardless of how long the cast, sling, splint, or the like, is actually worn.

Injection. Any application of medication through the use of a syringe, except a tetanus shot.

Bruise. The treatment of a bruise by drainage of blood.

Debridement. Surgical debridement, that is, the removal of dead or damaged skin.

Treatment of a burn. The treatment of a second-or third-degree burn is almost always medical treatment if the size of the affected area cannot be covered with a quarter.

Prescription medication. Any prescription medication prescribed or provided for a condition that is intended for subsequent use. A single dose taken orally or applied

externally on the initial visit is considered to be first aid and is not reportable. (See definition of prescription medication.)

Eye Injury. Removal of any object embedded in the eye, or the application of a patch or a bandage.

X-Ray. An X-Ray that is positive.

Whirlpool treatment. Any injury that requires more than one whirlpool treatment.

Multiple treatments. Any injury that results in additional treatment by a physician or other medical professional on a second or subsequent visit. This does not include a routine examination of the progress of an injury or instances where bandages or other dressings are replaced.

and the other two types of energy required at the point where the energy source is located. This is called the *gross energy content*.

The difference between the gross energy content and the net energy content is called the *losses*. These losses are due to the inefficiencies of the system.

It is important to note that the net energy content is the amount of energy available for use.

Another important factor is the *useful energy content*. This is the amount of energy that is actually used by the system.

If useful energy content is less than net energy content, then there is a loss of energy.

Finally, it is important to note that the useful energy content is the amount of energy that is actually used by the system.

If useful energy content is less than net energy content, then there is a loss of energy.

The counts under colum titled 'Total Incidents' are the number of incidents that resulted in a fatality or a nonfatal condition.

HRC = highway-rail crossing. Ftl = fatality. Nonf = nofatal injury or occupational illness of a railroad employee. W/O = without. Incs = incidents.

CHAPTER 4

EMPLOYEE ON DUTY CASUALTIES

The work environment is the physical location, equipment, materials processed or used, and activities of a railroad employee associated with his or her work, whether on or off the railroad's property. There are no stated exclusions of place or circumstance. All activities of a Worker on Duty--Employee (Class A) while in the work environment are presumed to be work-related for accident/incident reporting purposes.

An employee is in the work environment:

1. While engaged in work activity or apprenticeship/vocational training required by the employer.
2. While on break, in the rest room, or in storage areas when located on the employer's premises.
3. While performing work for pay or compensation at home, pursuant to the employer's instructions, if the injury or illness is directly related to the performance of work rather than the general home environment or setting.
4. While traveling on business, including to and from customer contacts. Employees in travel status (i.e., traveling on company business) should be considered engaged in work-related activities during all of their time spent in the "interest of their company". This includes, but is not limited to, travel to and from customer contacts, conducting job tasks, and entertaining or being entertained for the purpose of transacting, discussing, or promoting business.
5. While employee is engaged in work activity where a vehicle is considered part of the work environment (e.g., truck, taxi).
6. While at conferences where attendance is expected or required by the employer.
7. Some workplaces provide living quarters for employees on their premises. In these workplaces, injuries or illnesses are presumed to be work-related if the employee is on-duty or engaged in a work activity. The injury or illness is also considered work-related if the employee was harmed as a result of a serious workplace accident such as a chemical release, fire, explosion, derailment, collision, or building collapse. All other injuries and illnesses occurring during off-duty hours while in living quarters are considered non-work-related. The worker should be classified as an

“employee not on duty” in these cases if a reportable condition occurs.

Employees present in the work environment, but for reasons unconnected with their employment, generally are not reportable as Worker on Duty--Employee (Class A) should they be injured. These individuals are more appropriately classified as employees not on duty, nontrespassers on railroad property, passengers on train, etc., and if hurt should be identified as such. The following are examples:

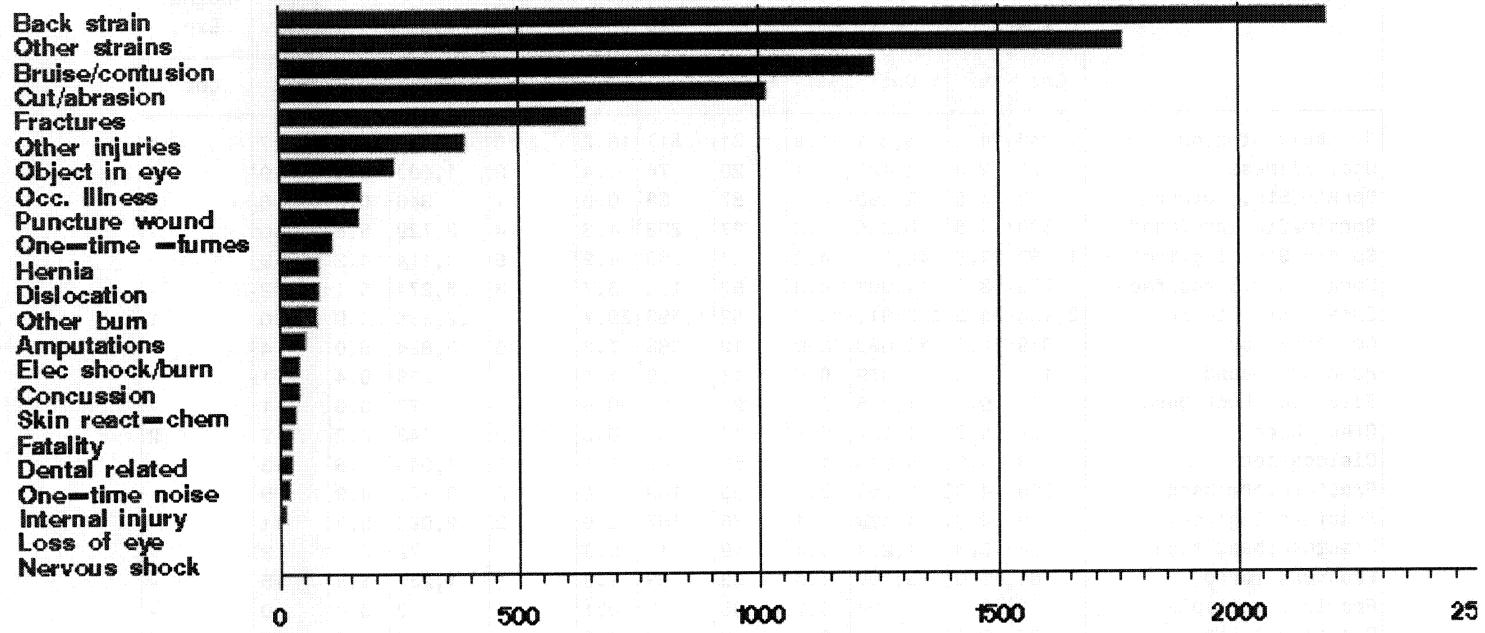

1. Injuries or illnesses that occur to employees present at their employer's establishment as a member of the general public rather than as a worker.
2. Injuries or illnesses that are solely the result of employees doing personal tasks (unrelated to their employment) at the establishment outside of normal working hours.
3. Injuries or illnesses occurring on company parking lots and access roads while employees are arriving at or leaving work.
4. An injury or illness solely associated with participation in voluntary community or civic projects, e.g., Operation Lifesaver presentations; unless the employee was under pay status.

Injury/Illness Distinction. The distinction between occupational illnesses and injuries is based primarily on the event or exposure that precipitated the employee's condition. Injuries are generally the result of instantaneous events; for example, an employee is struck by an object and sustains a cut or a bruise. Illnesses, on the other hand, are usually the result of an exposure that occurs over time; such as hearing impairment caused by working in a noisy environment. Exceptions to this general rule are muscular sprains, strains, or soreness, occurring after work activity for which no single movement or event can be isolated as the primary causal factor. Physical conditions of this type are to be recorded as injuries when the condition is attributable to activity of limited duration--typically no more than a single work shift.

4-1 EMPLOYEE ON DUTY CASES

Source: Bureau of Labor Statistics, 1997 Census of Fatal Occupational Injuries, 1997 Survey of Occupational Injuries and Illnesses.

Notes: Data are based on 1997 survey data. The survey covers all employees in private industry and government who were injured or ill at work during 1997.

Definitions: An employee on duty case is defined as an injury or illness that results in a day away from work, restricted work activity, or medical treatment. An employee on duty case is also defined as a case where an employee receives medical treatment, including first aid, at the worksite.

Cnt = count. % = percent of column total. Avg. = average. Term. = terminated. Trans. = transferred. Hazmat Exp. = condition was result of hazardous material exposure.

A day absent from work is any day (consecutive or not) following the date of injury or diagnosis of occupational illness that a railroad employee does not report to work for reasons connected with a reportable conditions.

A restricted work day is the inability of a railroad employee to perform all normally assigned duties of his or her regular job following a reportable condition. It includes temporary assignment to another job, being placed on restricted duties, or when the employee works less than full time at a regular job.

The count of "Absent cases" is the number of cases that resulted in an employee being absent from work.

CHAPTER 5

TRAIN ACCIDENTS

Collisions, derailments, fires, explosions, acts of God, or other events involving the operation of railroad on-track equipment (standing or moving) and causing reportable damages greater than the reporting threshold for the year in which the accident/incident occurred must be reported using Form FRA F 6180.54. The reporting threshold for calendar years 1992-1996 was \$6,300. The reporting threshold for calendar year 1997 was \$6,500, and in 1998 it was \$6,600.

Reportable damage includes labor costs and all other costs to repair or replace in kind damaged on-track equipment, signals, track, track structures, or roadbed. Reportable damage does not include the cost of clearing a wreck; however, additional damage to the above listed items caused while clearing the wreck is to be included in your damage estimate.

Examples of other costs included in reportable damage are: (1) rental and/or operation of machinery such as cranes, bulldozers, including the services of contractors, to replace or repair the track right-of-way and associated structures; and (2) costs associated with the repair or replacement of roller bearings on units that were derailed or submerged in water. (Replacement costs include the labor costs resulting from a wheel set change out.)

If the property of more than one railroad is involved in an accident/incident, the reporting threshold is calculated by including the damages suffered by all of the railroads involved. When total reportable damage to all railroads directly involved in an accident/incident exceeds the reporting threshold, a report is required even though an individual railroad's damages were below the threshold.

The tables displaying train accidents counts by railroad, are the number of events that a railroad was involved in, regardless of whether or not that railroad's operations were the primary reason the accident occurred. This is done because all railroads are required to report the extent of their involvement in the accident, regardless of whether or not there is agreement on the cause of the accident.

A form must be completed for each consist involved in an accident. The railroad responsible for the on-track equipment at the time of the accident, and only that railroad, will report the consist.

In joint operations, if the railroad having track maintenance responsibility did not also have on-track rail equipment involved, a report containing the track information must be forwarded.

Track information for accidents occurring on industry track of a non-reporting company is to be reported by the railroad operating the on-track equipment. Damages to industry track and on-track equipment are included in reportable damage.

A railroad need not report the following:

1. Cars derailed on industry tracks by non-railroad employees or non-railroad employee vandalism, providing there is no involvement of railroad employees;
2. Damage to out-of-service cars resulting from high water or flooding, e.g., empties placed on storage or repair track. This exclusion does not apply if such cars are placed into a moving consist and as a result of this damage, a reportable rail equipment accident results.

An equipment consist is a train, locomotive(s), cut of cars, or a single car not coupled to another car or locomotive.

A car is:

- (1) any unit of on-track equipment designed to be hauled by locomotives, or
- (2) any unit of on-track work equipment such as a track motorcar, highway-rail vehicle, push car, crane, or ballast tamping machine.

Locomotive. A locomotive is a piece of on-track equipment, other than hi-rail or specialized maintenance equipment,

- (1) With one or more propelling motors designed for moving other equipment;
- (2) With one or more propelling motors designed to carry freight or passenger traffic, or both; or
- (3) Without propelling motors but with one or more control stands.

Motorcar. A self-propelled unit of equipment, designed to carry freight or passenger traffic. (Does not include track motor cars or similar work equipment.)

Train. For purposes of accident/incident reporting, a train is a locomotive or locomotives coupled with or without cars, and with or without markers displayed. This definition includes trains consisting entirely of self-propelled units designed to carry passengers, freight traffic, or both.

Yard switching trains. Those trains operated primarily within yards for the

purpose of switching other equipment. Examples include the making up or breaking up of trains, service industrial tracks within yard limits, storing or classifying cars, and other similar operations.

Note: Switching performed by a road crew that is incidental to the road operation is not included.

Work trains are non-revenue trains used for the administration and upkeep service of the railroad. Examples are: official trains; inspection trains; special trains running with company fire apparatus to save the railroad's property from destruction; trains that transport the railroad's employees to and from work when no transportation charge is made; construction and upkeep trains run in connection with maintenance and improvement work; and material and supply trains run in connection with operations.

“*It is my personal belief that the best way to learn about a subject is to teach it to someone else.*” – Steve Jobs

That’s why I’m writing this book. I’m not a teacher, but I’m a student, and I’m here to help you learn about the most important concepts in the field of software development.

Software development is a complex field, and there are many ways to approach it. In this book, I’ll focus on the basics of software development, including the concepts of object-oriented programming, data structures, algorithms, and design patterns. I’ll also cover some more advanced topics, such as distributed systems, machine learning, and cloud computing. By the end of this book, you’ll have a solid understanding of the fundamental concepts of software development, and you’ll be well on your way to becoming a successful developer.

As you read through this book, I encourage you to take notes and experiment with the code examples. This will help you better understand the concepts and how they apply to real-world situations. You can also find additional resources and links to further reading at the end of each chapter.

I hope you find this book useful and informative. If you have any questions or comments, please feel free to reach out to me via email or on social media. I’d be happy to help you learn more about software development.

Type of accident

Coll = collision between on track equipment. Der = derailment. HRC = highway-rail crossing. Othr = other.

Causes

Eqp = equipment defect. HRC = highway-rail crossing. Hmn = Human factor. Sig = signal defect. Trk = track defect.
Othr = other.

Cnt = count. Ftl = fatality.

CHAPTER 6

TRAIN ACCIDENTS INVOLVING CONSISTS TRANSPORTING HAZARDOUS MATERIAL

Hazardous Material is any substance or material, including a hazardous substance, which has been determined by the Secretary of Transportation to be capable of posing an unreasonable risk to health, safety, or property when transported in commerce, and which has been so designated.

An incident resulting in damage to cars transporting hazardous material, or causing a release of the hazardous material, is not of and by itself a basis for reporting to FRA under the accident/incident rules. First, the incident must satisfy the criteria for train accident reporting described in the previous chapter. Namely, there must be total reportable damage to the rail equipment and track above the threshold. In 1997 the threshold was \$6,500, and in 1998 it was \$6,600.

All evacuations, including precautionary ones, in response to a potential release of hazardous material are required to be reported even if an actual release did not occur.

Additional information concerning any unintentional release of hazardous material during transportation by rail or other modes, is available through the Research and Special Programs Administration within the U. S. Department of Transportation.

CONTENTS

CHAPTER 6

TRAIN ACCIDENTS/INVOLVING CONSISTS TRANSPORTING HAZARDOUS MATERIALS

Figures		Page
6-1	Accidents involving consists transporting hazardous material, number of consists	6 - 5
Tables		
6-1	Consists transporting hazardous material, by railroad	6 - 6
6-2	Consists transporting hazardous material, by state	6 - 7

CHAPTER 6: INFORMATION SECURITY AND CYBERSECURITY

QUESTION

Which of the following is NOT a characteristic of a threat?

A. Threats can be both intentional and unintentional.
B. Threats can be both internal and external.
C. Threats can be both natural and man-made.

D. Threats can be both physical and non-physical.
E. Threats can be both legal and illegal.

QUESTION

What is the primary purpose of a penetration test?

A. To identify potential security vulnerabilities in a system or network.
B. To detect and repair hardware failures.
C. To monitor network traffic for suspicious activity.
D. To provide a detailed audit report of system performance.

CHAPTER 7

HIGHWAY-RAIL INCIDENTS

Any impact, regardless of severity, between a railroad on-track equipment consist and any user of a public or private crossing site, is to be reported on Form FRA F 6180.57. The crossing site includes sidewalks and pathways at, or associated with, the crossing.

In addition, whenever a highway-rail grade crossing accident/incident results in reportable damages greater than the current reporting threshold used for Rail Equipment Accident/Incident reporting, a Form FRA F 6180.54 must be completed. The reporting threshold for accidents for 1997 was \$6,500, and in 1998 it was \$6,600.

Highway users include but are not limited to: automobiles, buses, trucks, motorcycles, bicycles, recreational vehicles, farm vehicles, construction vehicles, roadway maintenance vehicles, and pedestrians.

Suicides or attempted suicides, as determined by a coroner or other public authority, at highway-rail crossing sites are not reportable. However, the event may be reportable under other criteria. For example, reportable conditions to others must be recorded on Form FRA F 6180.55a, e.g., the engineer sustained a fractured arm. Likewise, if the event caused reportable damage above the current monetary threshold for Rail Equipment Accidents/Incidents, a Form FRA F 6180.54 must be prepared. In these situations, the type of accident is coded as an "Obstruction".

Incidents involving highway users who have unsuccessfully attempted to avoid striking or being struck by a railroad consist at a crossing site are to be reported, regardless of where the actual impact between the consist and the highway user occurred.

Each reportable casualty resulting from a highway-rail crossing impact must also be reported on Form FRA F 6180.55a.

If the accident/incident satisfies the reporting requirements for rail equipment accidents (e.g., reportable railroad damage exceeds threshold), Form FRA F 6180.54 must also be completed by all railroads involved, including the railroad with track maintenance responsibility.

7.1.1. *Exponential Functions*

Exponential functions are functions of the form:

$y = a^x$, where $a > 0$ and $a \neq 1$.
The graph of $y = a^x$ passes through the point $(0, 1)$ and is increasing if $a > 1$ and decreasing if $0 < a < 1$.

Exponential growth occurs when there is a constant percentage increase over equal time periods. Exponential decay occurs when there is a constant percentage decrease over equal time periods. These situations are modelled by exponential functions.

The graph of $y = a^x$ passes through the point $(0, 1)$ and is increasing if $a > 1$ and decreasing if $0 < a < 1$. The graph of $y = a^x$ is shown below.

Exponential growth is used to model many real-life situations such as population growth, radioactive decay, compound interest, and depreciation. Exponential decay is used to model many real-life situations such as population decline, radioactive decay, and depreciation.

Exponential growth and decay can be modelled by the following equations:

If $y = a^x$ is an exponential function, then $\log_a y = x$.

Exponential growth is modelled by the equation $y = a^x$, where $a > 1$. Exponential decay is modelled by the equation $y = a^x$, where $0 < a < 1$.

CHAPTER 8

HIGHWAY-RAIL INCIDENTS AT PUBLIC CROSSINGS THAT INVOLVE MOTOR VEHICLES

FRA's reporting rules define any contact between a rail and highway user at a crossing site as a highway-rail incident. The following are situations that occur at or near crossing locations that do not qualify as highway-rail crossing incidents, but may require reporting under other provisions of the rule, e.g., train accident or casualty reporting.

- Q1. A man driving a truck did not see a train occupying a highway-rail crossing and lost control of his vehicle when he slammed on the brakes to avoid a collision. His truck ended up in the ditch with considerable damage, and he broke his arm. What reports are required?
 - A1. Since an impact did not occur between a highway and a rail user, you do not need to prepare a highway-rail accident/incident report (form 6180.57). The motorist did sustain a reportable injury arising from the operation of a railroad. Therefore, an injury report (form 6180.55a) must be completed. If the motorist had struck the consist, a form 6180.57 would be required even if the impact did not occur on the crossing site.
- Q2. A highway user hits a signal stand at a highway crossing and was injured, but there was no on-track equipment present, nor were railroad employees in the vicinity. Is this reportable?
 - A2. No. The regulation exempts the reporting of motor vehicle accidents at highway-rail crossing sites when they do not involve the presence of on-track equipment or railroad employees.
- Q3. A motorist in an off-road vehicle was waiting behind several automobiles at a crossing site where the gates were down and a standing train was occupying the track. He apparently became impatient and drove his vehicle off the highway and parallel to the track to a point where he could cross over the track behind the train. His vehicle stalled on a parallel set of tracks, and he was unable to start it. He exited his truck just before a train on the adjacent track hit it. Should this be reported as a highway-rail accident/incident or any other type?
 - A3. An event such as this would not qualify as a highway-rail crossing collision since the motor vehicle operator had left the highway of his own choosing and his vehicle was struck at a location other than a designated crossing site. The event would be reportable as an obstruction accident on form 6180.54 if reportable damage was in excess of the threshold. If the motorist or employees were hurt in connection with this event, then an injury report (form 6180.55a) would need to be completed.

the light source, the angle of incidence is zero, so the angle of reflection is also zero.

Figure 8.10 shows a light ray traveling from air into water. The angle of incidence is the angle between the incident ray and the normal to the surface at the point of incidence. The angle of refraction is the angle between the refracted ray and the normal to the surface at the point of incidence. The angle of reflection is the angle between the reflected ray and the normal to the surface at the point of incidence.

When light passes from one medium to another, it is bent away from the normal if the second medium has a lower refractive index than the first. Conversely, it is bent toward the normal if the second medium has a higher refractive index. This is illustrated in Figure 8.11, where light passes from water into air. The angle of refraction is greater than the angle of incidence, so the light is bent away from the normal.

When light passes from one medium to another, it is bent toward the normal if the second medium has a higher refractive index than the first. Conversely, it is bent away from the normal if the second medium has a lower refractive index. This is illustrated in Figure 8.12, where light passes from air into water. The angle of refraction is less than the angle of incidence, so the light is bent toward the normal.

When light passes from one medium to another, it is bent away from the normal if the second medium has a lower refractive index than the first. Conversely, it is bent toward the normal if the second medium has a higher refractive index. This is illustrated in Figure 8.13, where light passes from air into water. The angle of refraction is greater than the angle of incidence, so the light is bent away from the normal.

When light passes from one medium to another, it is bent toward the normal if the second medium has a higher refractive index than the first. Conversely, it is bent away from the normal if the second medium has a lower refractive index. This is illustrated in Figure 8.14, where light passes from water into air. The angle of refraction is less than the angle of incidence, so the light is bent toward the normal.

When light passes from one medium to another, it is bent away from the normal if the second medium has a lower refractive index than the first. Conversely, it is bent toward the normal if the second medium has a higher refractive index. This is illustrated in Figure 8.15, where light passes from air into water. The angle of refraction is greater than the angle of incidence, so the light is bent away from the normal.

When light passes from one medium to another, it is bent toward the normal if the second medium has a higher refractive index than the first. Conversely, it is bent away from the normal if the second medium has a lower refractive index. This is illustrated in Figure 8.16, where light passes from water into air. The angle of refraction is less than the angle of incidence, so the light is bent toward the normal.

When light passes from one medium to another, it is bent away from the normal if the second medium has a lower refractive index than the first. Conversely, it is bent toward the normal if the second medium has a higher refractive index. This is illustrated in Figure 8.17, where light passes from air into water. The angle of refraction is greater than the angle of incidence, so the light is bent away from the normal.

When light passes from one medium to another, it is bent toward the normal if the second medium has a higher refractive index than the first. Conversely, it is bent away from the normal if the second medium has a lower refractive index. This is illustrated in Figure 8.18, where light passes from water into air. The angle of refraction is less than the angle of incidence, so the light is bent toward the normal.

When light passes from one medium to another, it is bent away from the normal if the second medium has a lower refractive index than the first. Conversely, it is bent toward the normal if the second medium has a higher refractive index. This is illustrated in Figure 8.19, where light passes from air into water. The angle of refraction is greater than the angle of incidence, so the light is bent away from the normal.

When light passes from one medium to another, it is bent toward the normal if the second medium has a higher refractive index than the first. Conversely, it is bent away from the normal if the second medium has a lower refractive index. This is illustrated in Figure 8.20, where light passes from water into air. The angle of refraction is less than the angle of incidence, so the light is bent toward the normal.

CHAPTER 9

HIGHWAY-RAIL CROSSING INVENTORY

The Federal-Aid Highway Act of 1973 (Section 203) required that each State highway agency maintain an inventory of all crossings. According to the implementing instructions contained in the Federal-Aid Policy Guide, maintaining the National Inventory will satisfy the legislative requirement for a State Inventory. A primary purpose of the National Inventory is to provide for the existence of a uniform inventory data base which can be merged with accident/incident files and used to analyze information for planning and implementation of crossing improvement programs.

Railroads, with direction and guidance from the Association of American Railroads and the American Short Line Association, were assigned the responsibility for making a site-specific inventory of each highway-rail crossing and for installing a unique identifying number at each location. The railroads were also identified as being responsible for periodic updating of certain inventory information and maintenance of the crossing number.

The State highway-departments assisted in the project by providing site-specific highway location and use data. State public utility commissions and other State and local governmental agencies also participated in the project. The responsibility for the updating of certain highway information data items was determined to be the responsibility of the State and/or local governmental agencies.

The Inventory Data File is a record of grade crossing location, physical, and operational characteristics to provide information for the administration and statistical analysis of crossings. This information is reported on a voluntary basis to the FRA on the U.S. DOT-AAR Crossing Inventory Form.

The information contained on highway-rail incident reports is routinely merged with inventory data and the consolidated file is used for the development of Federal programs, funding alternatives for crossing improvement, studies related to railroad safety programs, effectiveness of warning devices, and for other safety programs and issues.

Although the inventory contains information on grade separated crossings, the counts appearing in this section are only for at-grade crossings, i.e., the locations where the potential exists for an impact between a rail and a highway user.

CULTURE AND POLITICAL PARTIES

When you think about politics, what comes to mind? Is it a political party? A political organization? A political culture? Or perhaps a political system? These are all different types of political entities, and they all play a part of politics. A political party is a group of people who share a common set of beliefs and values, and they work together to try to influence government or society. A political organization is a group of people who work together to achieve a specific goal, such as electing a candidate or changing a law. A political culture is a set of shared beliefs and values that are passed down through generations and influence how people think and act.

Political parties are important because they help to organize political power and influence. They represent different groups of people and their interests, and they work together to try to influence government policy. For example, the Democratic Party represents working-class people and the Republican Party represents middle-class people.

Political organizations are groups of people who work together to achieve a specific goal, such as electing a candidate or changing a law. For example, the Green Party represents environmentalists and the Libertarian Party represents individual freedom.

Political systems are the rules and institutions that govern a country or state. They include things like the constitution, laws, and government agencies. For example, the United States has a federal system where power is divided between the national government and state governments.

Political culture is a set of shared beliefs and values that are passed down through generations and influence how people think and act. For example, the American political culture values individual freedom and democracy.

Political parties, organizations, and systems all play a role in politics, but they are not the only factors that influence political behavior. Other factors include personal beliefs, social class, education, and family background. These factors can all affect how people vote and what they think about politics.

9-2 At-grade highway-rail crossings, by state	9 - 7
9-3 Public at-grade crossings, by warning device and railroad	9 - 8
9-4 Public at grade, by warning device and state	9 - 9
9-5 Private at-grade crossings, by type development and railroad	9 - 10
9-6 Private at-grade crossings, by type development and state	9 - 11

the first time. It is important to remember that the first time you do something, it is likely to be less effective than the second time. This is because the first time you do something, you are still learning how to do it correctly. The second time you do something, you have already learned how to do it correctly, so you can do it more effectively.

What is the first step?

What is the second step?

What is the third step?

CHAPTER 10

TRESPASSERS, NOT AT HIGHWAY-RAIL CROSSINGS

A “trespasser” is defined as any person who is on that part of railroad property used in railroad operation and whose presence is prohibited, forbidden, or unlawful. Employees who are trespassing on railroad property are to be reported as “Trespassers” (Class E).

A person on a highway-rail crossing should not be classified as a trespasser unless the crossing is protected by gates, or other similar barriers that were closed when the person went on the crossing, or unless the person attempted to pass over, under, or between cars or locomotives of a consist occupying the crossing. Although these individuals are identified as “trespassers” on form FRA F 6180.55a, they are excluded from this chapter because the incident is defined as a highway-rail incident. These casualties can be found in Chapters 7 and 8 that summarize highway-rail crossing incidents.

APPENDIX A

ABBREVIATIONS

%	Percent of total
AADT	Average annual daily traffic
Acc	Accident, events reported on form 6180-54 (Chapter 6)
Avg	Average
Chg	Change
Cls	Class
Cnt	Count
Coll	Collision between ontrack equipment
Comm	Commuter
Der	Derailment
EOD	Railroad employee on duty
Eqp	Equipment
Exp	Exposure
Ftl	Fatality
HRC	Highway-rail crossing
HWTS	Highway traffic signals
Hmn	Human factor
Incs	Incidents
Len	Length
Loco	Locomotive
Mtr V	Motor vehicle
Nonf	Nonfatal cases (injuries and occupational illnesses)
Othr	Other
Psgn	Passenger on train
RR	Railroad
Rng	Range
Sig	Signal
Spd	Speed
Term	Terminated
Trans	Transferred
Tres	Trespasser
Trk	Track
Trn	Train
Unk	Unknown
Veh	Vehicle
WW	Wiwags
w/o	Without

APPENDIX B

ACCIDENT PREDICTION AND RESOURCE ALLOCATION PROCEDURE NORMALIZING CONSTANTS

The U.S. DOT Highway-Rail Crossing Resource Allocation Procedure, as described in the *Rail-Highway Crossing Resource Allocation Procedure User's Guide, Third Edition*, August 1987, DOT/FRA/OS-87/10, uses three "normalizing constants" in the accident prediction formula, Formula A, Section 3.2.4, Page 17. These constants need to be adjusted periodically in order to keep the procedure matched with the current accident trends. The last recalculation and adjustment was made for Calendar Year 1992 and published in Bulletins No. 14 through 19.

The process of determining the three (3) new "normalizing constants" for 1998 is performed such that the 1997 accident prediction sum of the top 20 percent of the crossings is made to equal the sum of the *observed* number of accidents that occurred for those same 20 percent of crossings using the accident data for Calendar Years 1992 to 1996 (to predict 1997). The *observed* accidents are those accident records that are in the data file. Because of inaccurate reporting which results in some mismatched data records, the number of *observed* accidents normally will not be equal to the actual number of accidents which have occurred and as reported in the yearly Bulletin. This process is performed for each of the respective three formulae for the three types of warning device groups, (1) passive, (2) flashing lights, and (3) gates. This process normalizes the calculated prediction for the current trend in accident data (downward) and relative to each of the three types of warning devices.

These constants were redetermined for the "national" model using the crossings in the National Inventory File as of December 1997. Those using the "DOT Model" should update their models by replacing the old constants with the new recalculated values. These "normalizing constants" are located in the computer program ACPD.NEW as shown in the *User's Guide Third Edition* at the top of Page A-4, Appendix A1 and in RESAL.NEW on Page B-3, Appendix B1.

As of August 1998, these new constants will be in the computer program used to fulfill requests for accident prediction and resource allocation listings, as well as in the new 1998 PCAPS Computer Program containing 1997 data. The table below lists the new and prior constants.

ACCIDENT PREDICTION AND RESOURCE ALLOCATION PROCEDURE NORMALIZING CONSTANTS

WARNING DEVICE GROUPS	NEW 1998	PRIOR YEARS			
		1992	1990	1988	1986
(1) Passive	.7159	.8239	.9417	.8778	.8644
(2) Flashing Lights	.5292	.6935	.8345	.8013	.8887
(3) Gates	.4921	.6714	.8901	.8911	.8131
