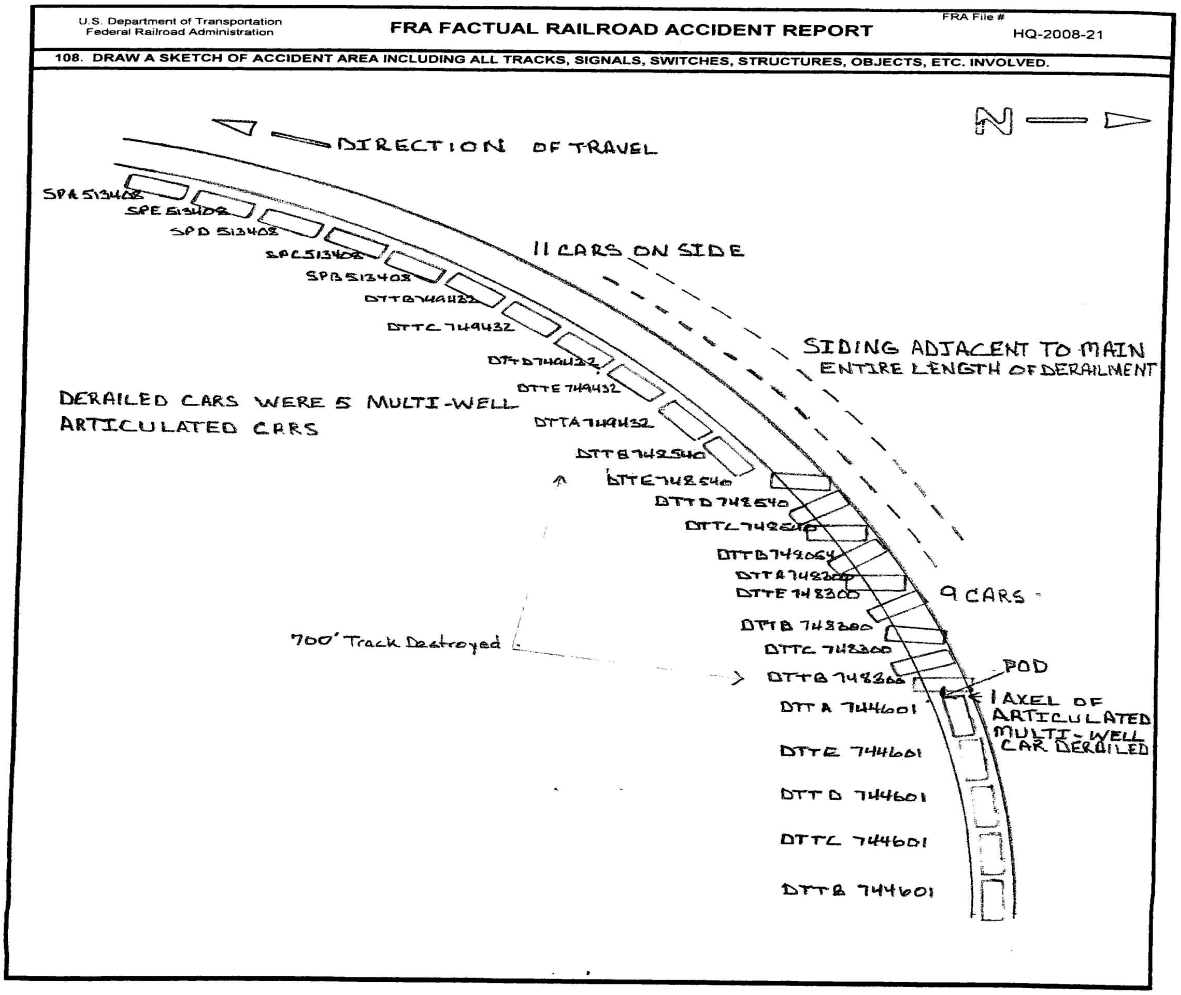
136. DRAW A SKETCH OF ACCIDENT AREA INCLUDING ALL TRACKS, SIGNALS, SWITCHES, STRUCTURES, OBJECTS, ETC., INVOLVED.



137. SYNOPSIS OF THE ACCIDENT

On February 26, 2008, at 11:50 p.m. CST westbound Union Pacific (UP) Freight Train, # IAVLBX-25 derailed at UP Milepost 609.30 on the UP Sanderson Subdivision of the San Antonio Service Unit. This is a rural area located immediately west of Alpine, TX. Twenty-five cars of the 124 car train derailed. Two hazardous cars were included in the derailed cars however there was no release of product. There was a precautionary evacuation ordered by fire officials affecting six people. There were no injuries reported. The 64th thru the 88th loaded head cars behind the four locomotives derailed.
At the time of the accident it was dark and clear. The temperature was 19 degrees F.

The damages were listed at $ 721,047 ($ 666,367 to equipment and $ 54,680 to track)

PROBABLE CAUSE

The cause of the derailment was due to a broken rail – a detail fracture from shelling or head check, FRA cause code T207.

138. NARRATIVE

CIRCUMSTANCES PRIOR TO THE ACCIDENT:

The crew of UP Freight Train # IAVLBX-25 included a locomotive engineer and a conductor. The crew went on duty at 11:15 p.m. CST on February 26, 2008 at Alpine Texas. The train was scheduled to travel from Alpine to El Paso. El Paso is the home terminal for both crew members. Both crew members had received more than the required statutory off duty rest period prior to reporting for duty.

The train consisted of four locomotives, 124 platform cars. It was 7,632 gross tons and 7,636 feet long and was scheduled to travel from Avondale, LA to Long Beach, CA. The train received a Train Air Brake test at Avondale, LA at 8:20 p.m. on February 24, 2008 by qualified mechanical inspectors. No exceptions were noted as a result of the inspection. The train's End of Train Device (EOTD identified as Number UPRQ 061 808) was also inspected at Avondale at 6:45 p.m. on February 24, 2008.

As the Westbound train approached the accident area, the locomotive engineer was seated at the controls on the north side of the leading locomotive. The conductor was seated on the south side of the leading locomotive.
The grade of the railroad at the point of derailment is a 1.00 percent ascending grade as you approach this area from the east. The track is in a 3-degree 37- minute curve to the left.

The railroad time table direction of the train was west. The geographic direction of the train was southwest. The Timetable directions will be used throughout the report.

As indicated by Union Pacific RR Co. San Antonio Area Timetable No.3, the method of operation at milepost 609.3 of the Sanderson Subdivision was Centralized Traffic Control (CTC).
The weather was reported as dark and clear. The temperature was 19 degrees F.

THE ACCIDENT:

The crew proceeded westward from the crew change point in Alpine, Texas and gradually increased the speed of the train to 30 mph. The speed was recorded by the event recorder of the lead locomotive. The maximum authorized speed for this segment of track is 50 mph governed by the Sanderson Subdivision General Order No. 2. There were no temporary slow orders in effect for this segment of track.

The engineer commented that the train handled smoothly, having worked the throttle to position eight, when he felt a tug on the train. The engineer then went to throttle position five and the train went into an emergency brake application. When the air would not build up on the rear of the train, the conductor began to walk back to inspect the train. He discovered the derailed cars. He continued to walk back toward the rear of the train and found 25 additional cars derailed, lines 64 through 88 of the train consist list.
ANALYSIS:

The train was equipped with a speed indicator and an event recorder as required. The relevant event recorder data was downloaded and analyzed by the UP Manager Road Operations at the accident site. The train crew was administered a Post Accident Toxicology Test. A broken rail was found at the site which was determined to be the result of a detail fracture. The rail which was manufactured in 1986 had originally been laid on the high side of the curve at milepost 609.3. In 2004 that rail was transposed to the low side of the same curve. The rail, which had previously been surface ground in July of 2007, showed considerable evidence of head wear and shelling on the rail surface. On February 12, 2008 the rail in the area of the derailment had been tested by an ultra-sonic rail detector car with no internal defects noted.

ANALYSIS:

FRA obtained fatigue related information, for the 10-day period preceding this incident including the 10-day work history (on duty/off duty cycles) for all of the employees involved.

CONCLUSION:

Upon analysis of that information FRA concluded fatigue was not probable for any of the employees.

CONCLUSIONS:

Toxicology Tests for both crew members revealed negative test results. Track geometry measurements were within FRA Standards. The locomotive engineer was in compliance with all applicable railroad operating and train handling requirements, which was confirmed by the relevant event recorder data. Rail flaw detector reports showed three internal defects had been found in the low rail of this curve in 2007. The service failure report shows three broken rails occurring in this same curve, also in the low rail, on November 5, 2007, December 16, 2007, and February 10, 2008. Based on the rail found at the point of derailment and the defect history of the rail in this curve, the cause of the derailment was determined to be a broken rail - detail fracture.

PROBABLE CAUSE:

The cause of the derailment was due to a broken rail–detail fracture from shelling or head check, FRA cause code T207.
