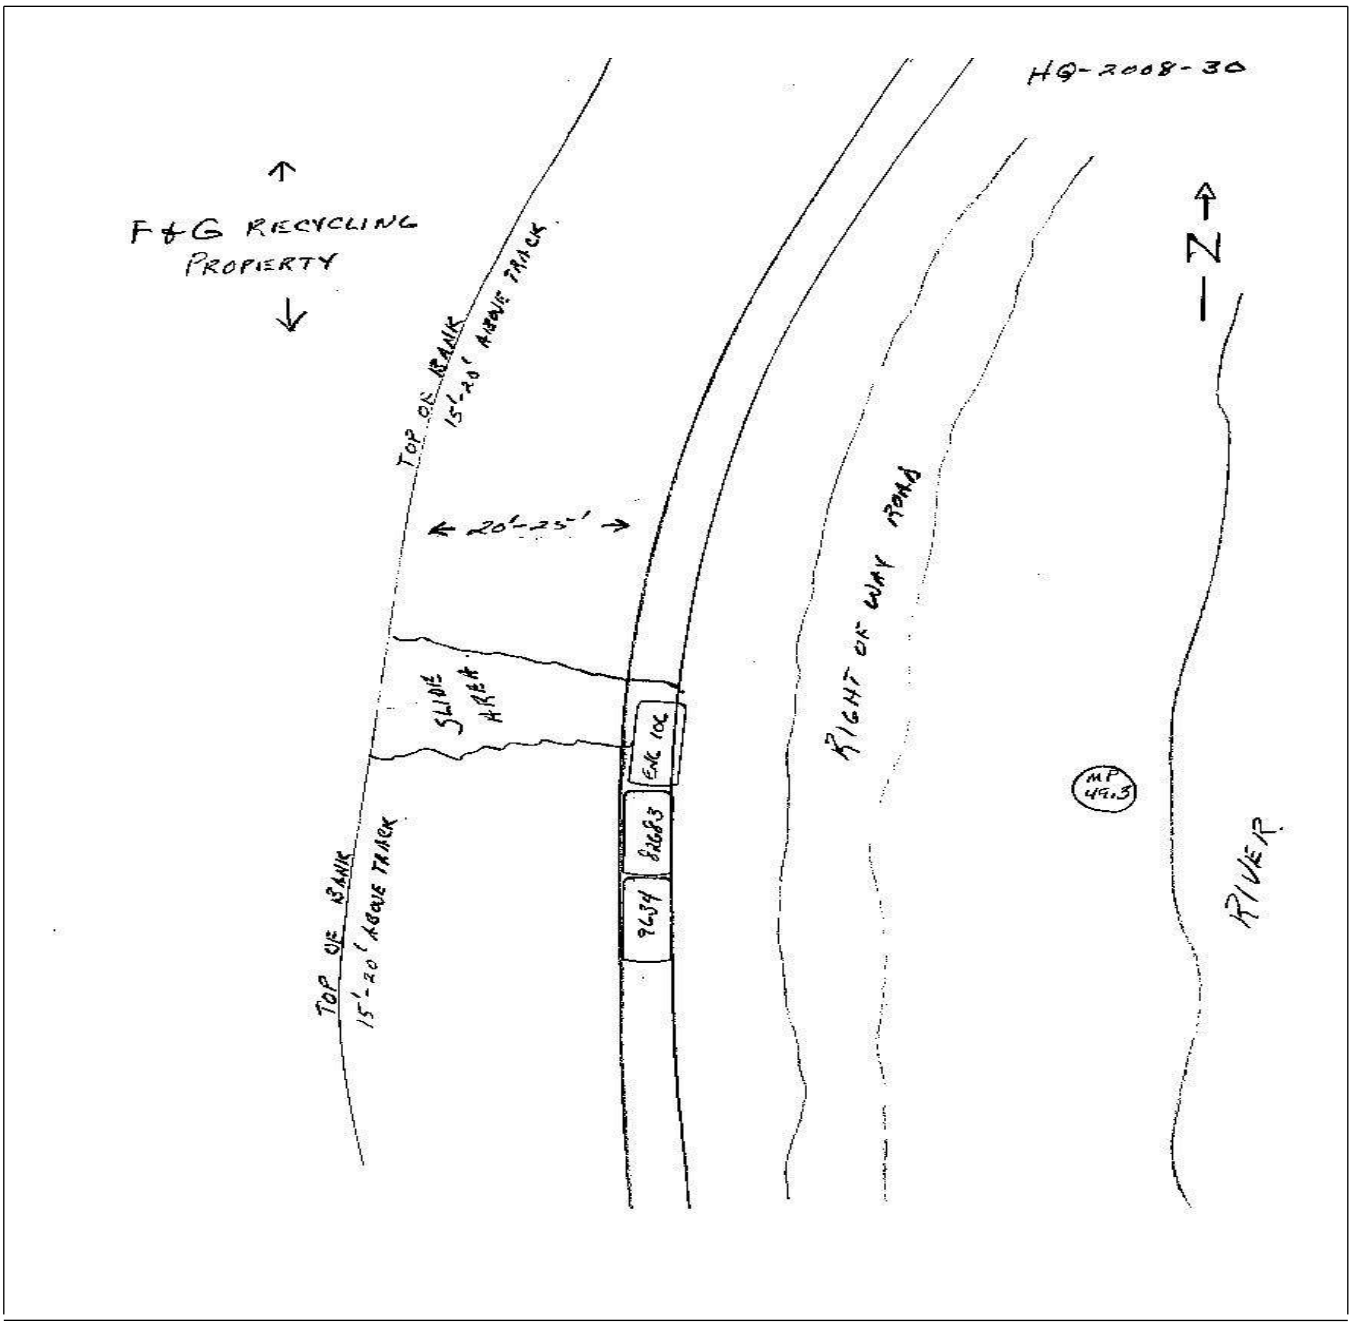
136. DRAW A SKETCH OF ACCIDENT AREA INCLUDING ALL TRACKS, SIGNALS, SWITCHES, STRUCTURES, OBJECTS, ETC., INVOLVED.



137. SYNOPSIS OF THE ACCIDENT

On March 17, 2008, at approximately 9:56 a.m. EST Amtrak (ATK) Passenger Train # 490 operating northbound on the Amtrak Springfield Line at milepost 49.3 north of Windsor Locks, CT in Hartford County derailed locomotive # AMT 106. The engineer of northbound ATK Train # 490 approached the area and slowed for a speed restriction of 30 mph beginning at milepost 49.3. He observed tree branches covering the track ahead and as he got closer, he noticed a mud slide with large trees on the track. The engineer put the train into emergency and told the Conductor to brace himself for impact. The locomotive hit the mudslide and derailed upright to the east side in line with the track.

The engineer made an emergency call to the Springfield Line Dispatcher and reported that they had hit a mudslide and derailed the locomotive. The engineer checked with the conductor and he reported no injuries to any passengers or crewmembers.

The Engineer stated that while traveling southbound earlier in the morning he did not notice anything out of the ordinary within the milepost 49.3 area.

There was approximately $ 47,021.00 damage to the equipment.

The weather was clear and 40 degrees F.

The probable cause of the derailment was a mudslide on the track.

138. NARRATIVE

CIRCUMSTANCES PRIOR TO THE ACCIDENT

After completing the required statutory off duty rest period of 12 hours, the Engineer and crew went on duty at Springfield, MA at 4:55 a.m. on March 17, 2008 and proceeded to collect all the necessary paperwork and conducted a job briefing. Their normal tour of duty is from Springfield, MA as Amtrak Train # 141 to New Haven, CT and return on ATK Train # 490.

They then called the Springfield Line Dispatcher and reported crew names and on duty times and then inspected ATK locomotive # 105 and the remainder of ATK Train # 141 and conducted an air brake test and updated their job briefing.
They departed Springfield at 5:35 a.m. with ATK Train # 141 and proceeded southbound to New Haven, CT and reportedly experienced an uneventful trip. The engineer stated that while traveling south through the area of milepost 49.3, he did not observe anything out of the ordinary.

They arrived in New Haven at 7:28 a.m. and switched trains and departed at 8:38 a.m. on ATK Train # 490 with ATK locomotive # 106, ATK Coach Car # 82638 and ATK Control Car # 9634. The northbound trip was uneventful to the Windsor Locks, CT Amtrak station.

THE ACCIDENT

After departing the Windsor Locks Train Station at 9:51 a.m. northbound at the authorized timetable speed of 80 mph, the engineer was slowing down for a temporary speed restriction of 30 mph at milepost 49.3, when he noticed branches covering the track ahead and as approached he noticed the mudslide covering the tracks.

He immediately put the train into emergency and told the conductor to brace himself for the impending impact and then collided with the mudslide. After coming to a stop at approximately 9:58 a.m. the engineer made an emergency call by radio to the Springfield Line dispatcher and reported his train had hit a mudslide at

milepost 49.3 and had derailed the locomotive. He then left the locomotive and checked with the conductor and was told there were no reported injuries to the crew or 6 passengers that were on board.

ANALYSIS

The F & G Recycling facility is located on the west side of the track in the vicinity of milepost 49.3. Over an extended period of time an earth berm has been constructed about 15 to 20 feet above the track level and approximately 20 to 25 feet from the track to the west. This bank runs parallel to the track for about a quarter of a mile in this area.

After speaking to several Amtrak employees at the scene, they indicated that F & G Recycling has been piling snow on the top of this bank at this location all winter which most likely allowed the bank to become saturated by the snow melt and the recent heavy rains and for unknown reasons gave way.
This track is required to be inspected twice weekly per Rule 49 CFR Part 213.233 because of passenger train operations and class of track (FRA Class 4). The track was last inspected on Thursday, March 13, 2008 and was to be inspected behind ATK Passenger Train # 490 on the day of the derailment.

CONCLUSION:

There was no way for the engineer to know there was a problem ahead of his train since the mudslide did not disturb the track bed to the extent of a signal interruption indication and that he had not noticed anything out of the ordinary in this area earlier in the day.

PROBABLE CAUSE AND CONTRIBUTING FACTORS:

This bank location apparently became saturated by the piles of snow and the recent heavy rains and allowed the bank to become saturated and unstable. The cause of the derailment was a mudslide on the track.
